Preventive orthodontic intervention in the early mixed dentition

Xiaobing Li BDS, DDS, PhD, M OrthRCSEd

Professor, Associated Head of Department of Pediatric Dentistry
West China School of Stomatology,
Sichuan University

One of the most important works in Pediatric dentistry is monitoring the development of children's occlusions. The main purpose of the Pediatric dentists is to prevent, to intervene any oral problems which could cause the deviation of the development of the occlusion. Normally the occlusion guidance include caries control and therapy, space management of early lost deciduous teeth, treatments of anterior crossbits and interrupting any oral habit. Preventive orthodontic treatments in Pediatric dentistry are adjunctive treatments to help to monitor the well development of the children's occlusions. The preventive orthodontic treatments can use any kinds of removable appliances, segmental fixed appliances or combine used of removable and fixed appliances. Occlusions guidance starting at the early mixed dentition would effectively reduce the malocclusions, make the malocclusion less severe, ease the further orthodontic treatments in permanent dentitions. Preventive orthodontic treatment in early mixed dentition is proved a very effective method to solve the deviation of development of occlusions.
